How to convert 3.7V to 12V boost converter circuit?

Above 3.7V to 12V boost converter circuit is implemented using variable output IC LM2577-ADJ. This can be implemented using a fixed output 12V switching IC LM2677T-12 which comes under the LM2577 series step-up voltage regulator. Here, we need  $V_o = 12V$ , then assume the value of either R5 or R6 then find for the other.

What is a voltage boost converter?

The voltage boost converter module that provides 3.7V DC stable voltage output at various input ranges between 3.7V to 12V. This small tiny circuit boosts the voltage level and provides the amplified stabilized 5V/8V/9V 12V output. For the different input ranges, it consumes a different amount of current to produce a balanced output.

What is the input voltage range of a boost converter?

**Wide Input Voltage Range:** With an input voltage range of 2.5V to  $V_{OUT}$ , this boost converter is designed to accept various power sources, including 3.7V lithium batteries and even 5V power supplies. Just remember that the input voltage must always be lower than the selected output voltage.

How many amps can a DC-DC boost converter deliver?

For an input of 3.7V or more, the output of this IC's can deliver a maximum of 2.0A. These DC-DC boost converter modules operate at the frequency  $\geq 1.2MHz$ , the typical output is 93% efficient. Thermal overload protection in case of output overload. Maximum output current up to 2.0 Amps. The typical switching frequency is  $\sim 1.2MHz$ .
