In many cases, using a 48V battery with a 36V motor is too risky, and it is better to upgrade to a motor or controller designed for 48V, which can improve performance, lower the ...

Your inverter should match the DC voltage of your battery or solar system--e.g., 36 V input for a 36 V battery bank. Mismatches can cause poor performance or damage. Try to operate your ...

Operating the inverter at such a low voltage will probably limit it's maximum power output. However, my data sheets indicate the lower voltage is 38V, so 36V is not likely to work.

By understanding the basics of voltage, wiring configurations, and component compatibility, you can confidently design and install a reliable 36V power system for your ...

In short, while a boost converter might work in a controlled, low-power environment or as a short-term experiment, it is not a recommended long-term solution for powering a 48V ...

If you can find out what cells are inside you could buy four 36V and dismantle to rebuild as three 48V as an example.

While technically possible to run a 48V motor on a 36V battery, the practice comes with significant compromises in performance, reliability, safety, and overall value.
