How can metallographic assessment of battery components be performed?

Individual cells and/or battery packs assemblies can be evaluated metallographically to validate battery chemistries and construction, and the inspection of various joining techniques used to make the packs. The following article will highlight the procedures that can be adopted for metallographic assessment of various battery components.

What is a castable mounted sample?

Castable mounted samples are ideal for terminal weld evaluations, dimensional checks and battery cap assembly region check, as the technique ensures weld integrity without distortion and/or damage compared to a compression (hot) mounting process (SumMet, 2018).

What is the internal cell structure of a lithium ion battery?

The internal cell structure of a lithium ion battery consists of an outer cylindrical casing protecting the internal active cell elements made of a graphite anode, a lithium metal oxide cathode, an electrolyte of a lithium salt and an organic sol-vent.

Which resin should be used to mount a battery?

If the samples are to be mounted, castable mounting technique should be adopted using epoxy-based resins, such as Epothin 2 or EpoxiCure 2. Epoxide resins are preferred due to their low peak exotherm temperatures during curing as well as their low reactivity with battery constituent elements.
