An inverter increases the DC voltage, and then changes it to alternating current before sending it out to power a device. These devices ...

The main function that an inverter serves is to change DC (direct current) power to AC (alternating current) power. This is vital in ...

I have a function whose structure is similar to the above. I want to abstract task 3 into a function, `bar()`, but I wish to limit the access of this function to only within the scope of `foo(a)`.

This is the core of the inverter that is responsible for managing the switching of electric conversion. It also regulates the voltage so that ...

A function of that nature can be called at any time, anywhere. jQuery (a library built on Javascript) has built in functions that generally required the DOM to be fully rendered before being called.

About `__func__`: "The identifier `__func__` is implicitly declared by the translator as if, immediately following the opening brace of each function definition, the declaration: `static ...`
